Subject: Glyphosate NSRL
Date: Sunday, May 14, 2017 7:28:08 PM

I practice medicine in Fair Oaks, CA, and would like to offer information that suggests there is no safe amount of glyphosate which should be accepted in what humans and animals consume.

Glyphosate acts like an amino acid and enters proteins widely. There it interferes with a wide variety of functions. Research is now coming to light that directly contradicts earlier statements and beliefs that glyphosate is harmless and does not accumulate in the human body.

This research documents some of the problems in detail: https://www.researchgate.net/publication/316601847_Glyphosate_pathways_to_modern_diseases_VI_Prions_amyloidoses_and_autoimmune_neurological_diseases

Glyphosate is so widely used and has been for so many years, it will take a real clean-up to fully eliminate it from the environment. This must be undertaken. The population is under enormous stress health-wise from many untested chemicals. Further, the population faces a growing burden of radiation as Sacramento becomes one of the targets for 5G internet, another poorly tested influence which appears to concentrate on the skin of human beings.

As new research is available, it is important that regulatory groups act on these facts, even if the situation is complex. The people of California are not consumers who exist for the sake of a chemical company or an internet company. The health of the people must be put foremost.

Thank you for listening.
